1 Navigation

In this notebook, you will learn how to use the Unity ML-Agents environment for the first project of the [Deep Reinforcement Learning Nanodegree](#).

1.0.1 1. Start the Environment

We begin by importing some necessary packages. If the code cell below returns an error, please revisit the project instructions to double-check that you have installed [Unity ML-Agents](#) and [NumPy](#).

```
In [1]: from unityagents import UnityEnvironment
import gym
import random
import torch
import numpy as np
from collections import deque
import matplotlib.pyplot as plt
%matplotlib inline
```

Next, we will start the environment! *Before running the code cell below*, change the `file_name` parameter to match the location of the Unity environment that you downloaded.

- **Mac**: "path/to/Banana.app"
- **Windows (x86)**: "path/to/Banana_Windows_x86/Banana.exe"
- **Windows (x86_64)**: "path/to/Banana_Windows_x86_64/Banana.exe"
- **Linux (x86)**: "path/to/Banana_Linux/Banana.x86"
- **Linux (x86_64)**: "path/to/Banana_Linux/Banana.x86_64"
- **Linux (x86, headless)**: "path/to/Banana_Linux_NoVis/Banana.x86"
- **Linux (x86_64, headless)**: "path/to/Banana_Linux_NoVis/Banana.x86_64"

For instance, if you are using a Mac, then you downloaded `Banana.app`. If this file is in the same folder as the notebook, then the line below should appear as follows:

```
env = UnityEnvironment(file_name="Banana.app")
```

```

In [2]: env = UnityEnvironment(file_name="/home/pedro/deep-reinforcement-learning/p1_navigation/

INFO:unityagents:
'Academy' started successfully!
Unity Academy name: Academy
    Number of Brains: 1
    Number of External Brains : 1
    Lesson number : 0
    Reset Parameters :

Unity brain name: BananaBrain
    Number of Visual Observations (per agent): 0
    Vector Observation space type: continuous
    Vector Observation space size (per agent): 37
    Number of stacked Vector Observation: 1
    Vector Action space type: discrete
    Vector Action space size (per agent): 4
    Vector Action descriptions: , , ,

```

Environments contain *brains* which are responsible for deciding the actions of their associated agents. Here we check for the first brain available, and set it as the default brain we will be controlling from Python.

```

In [3]: # get the default brain
        brain_name = env.brain_names[0]
        brain = env.brains[brain_name]

```

1.0.2 2. Examine the State and Action Spaces

The simulation contains a single agent that navigates a large environment. At each time step, it has four actions at its disposal: - 0 - walk forward - 1 - walk backward - 2 - turn left - 3 - turn right

The state space has 37 dimensions and contains the agent's velocity, along with ray-based perception of objects around agent's forward direction. A reward of +1 is provided for collecting a yellow banana, and a reward of -1 is provided for collecting a blue banana.

Run the code cell below to print some information about the environment.

```

In [ ]: # reset the environment
        env_info = env.reset(train_mode=True)[brain_name]

        # number of agents in the environment
        print('Number of agents:', len(env_info.agents))

        # number of actions
        action_size = brain.vector_action_space_size
        print('Number of actions:', action_size)

        # examine the state space
        state = env_info.vector_observations[0]

```

```

print('States look like:', state)
state_size = len(state)
print('States have length:', state_size)

```

1.0.3 3. Take Random Actions in the Environment

In the next code cell, you will learn how to use the Python API to control the agent and receive feedback from the environment.

Once this cell is executed, you will watch the agent's performance, if it selects an action (uniformly) at random with each time step. A window should pop up that allows you to observe the agent, as it moves through the environment.

Of course, as part of the project, you'll have to change the code so that the agent is able to use its experience to gradually choose better actions when interacting with the environment!

```
In [ ]: from dqn_agent import Agent
```

```

agent = Agent(state_size=37, action_size=4, seed=0)
agent.qnetwork_local.load_state_dict(torch.load('checkpoint.pth'))

env_info = env.reset(train_mode=False)[brain_name] # reset the environment
state = env_info.vector_observations[0]             # get the current state
score = 0                                           # initialize the score
while True:
    action = agent.act(state, eps=0.0)              # get action (eps=1 means random action)
    env_info = env.step(action)[brain_name]         # send the action to the environment
    next_state = env_info.vector_observations[0]     # get the next state
    reward = env_info.rewards[0]                   # get the reward
    done = env_info.local_done[0]                  # see if episode has finished
    score += reward                                 # update the score
    state = next_state                             # roll over the state to next time step
    if done:                                       # exit loop if episode finished
        break

print("Score: {}".format(score))

```

1.0.4 4. It's Your Turn!

Now it's your turn to train your own agent to solve the environment!

```
In [4]: from dqn_agent import Agent
```

```

agent = Agent(state_size=37, action_size=4, seed=0)
agent.qnetwork_local.load_state_dict(torch.load('checkpoint.pth'))

def dqn(n_episodes=2000, eps_start=0.01, eps_end=0.01, eps_decay=0.995):
    """Deep Q-Learning.

    Params
    =====

```

```

        n_episodes (int): maximum number of training episodes
        eps_start (float): starting value of epsilon, for epsilon-greedy action selection
        eps_end (float): minimum value of epsilon
        eps_decay (float): multiplicative factor (per episode) for decreasing epsilon
    """
    scores = [] # list containing scores from each episode
    scores_window = deque(maxlen=100) # last 100 scores
    eps = eps_start # initialize epsilon
    for i_episode in range(1, n_episodes+1):
        env_info = env.reset(train_mode=True)[brain_name]
        state = env_info.vector_observations[0]
        score = 0
        while True:
            action = agent.act(state, eps)
            env_info = env.step(action)[brain_name]
            next_state = env_info.vector_observations[0]
            reward = env_info.rewards[0]
            done = env_info.local_done[0]
            agent.step(state, action, reward, next_state, done)
            score += reward
            state = next_state
            if done:
                break

        scores_window.append(score)
        scores.append(score)
        eps = max(eps_end, eps_decay*eps)
        print('\rEpisode {} \tAverage Score: {:.2f}'.format(i_episode, np.mean(scores_window)))
        if i_episode % 100 == 0:
            print('\rEpisode {} \tAverage Score: {:.2f}'.format(i_episode, np.mean(scores_window)))
            torch.save(agent.qnetwork_local.state_dict(), 'checkpoint.pth')
        if np.mean(scores_window) >= 100.0:
            print('\nEnvironment solved in {:d} episodes! \tAverage Score: {:.2f}'.format(i_episode, np.mean(scores_window)))
            torch.save(agent.qnetwork_local.state_dict(), 'checkpoint.pth')
            break
    return scores

scores = dqn()

# plot the scores
fig = plt.figure()
ax = fig.add_subplot(111)
plt.plot(np.arange(len(scores)), scores)
plt.ylabel('Score')
plt.xlabel('Episode #')
plt.show()

```

Episode 100 Average Score: 2.56

Episode 200	Average Score: 9.18
Episode 300	Average Score: 10.81
Episode 400	Average Score: 13.66
Episode 500	Average Score: 15.74
Episode 600	Average Score: 16.35
Episode 700	Average Score: 16.16
Episode 800	Average Score: 15.85

Episode 1600	Average Score: 16.06
Episode 1700	Average Score: 16.38
Episode 1800	Average Score: 15.82
Episode 1900	Average Score: 16.06
Episode 2000	Average Score: 15.99

Now watch the result of training

```
In [ ]: agent.qnetwork_local.load_state_dict(torch.load('checkpoint.pth'))

env_info = env.reset(train_mode=False)[brain_name] # reset the environment
```

```

state = env_info.vector_observations[0]
score = 0
while True:
    action = agent.act(state, eps=0.0)
    env_info = env.step(action)[brain_name]
    next_state = env_info.vector_observations[0]
    reward = env_info.rewards[0]
    done = env_info.local_done[0]
    score += reward
    state = next_state
    if done:
        break

print("Score: {}".format(score))

env.close()

```

```

# get the current state
# initialize the score

# get action (eps=0 means trained)
# send the action to the environment
# get the next state
# get the reward
# see if episode has finished
# update the score
# roll over the state to next time step
# exit loop if episode finished

```
